

CyberSavvyIQ

IMMERSIVE

Cybersecurity awareness training

CyberSavvyIQ is a series of next generation security awareness training published by CyberCatch. It combines the best of two entertainment worlds, movies and games, into an immersive virtual reality experience like no other.

It is a series of learning games that simulate how cyber attackers actually steal data and install ransomware and is based on actual cyber attacks.

ROLE PLAY

Real-world cyber attacks

Hack Ops is the first learning game in the series. Since there are two primary ways cyber attackers are breaking into the network and stealing data and installing ransomware (i.e. spear phishing and exploiting vulnerabilities), the learner will role play a "newbie hacker" and learn HOW:

- Hackers do reconnaissance
- Spear phishing is crafted & executed
- Front-door internet-facing IT assets vulnerabilities are exploited
- Third-party vulnerabilities are exploited to break in from the back door
- Data is exfiltrated & ransomware is installed & what could have prevented the harm from occurring
- Unknown back doors are left behind and why

Everything is based on recent, blockbuster cyberattacks, simulating the attacker, so the learning is real-world, entertaining, sticky and lasting.

There is also a "Hollywood" movie-style surprise ending waiting for the learners at the end of the game.

Make your employees CYBER SMART, so
your organization becomes CYBER STRONG.
